larger than 180° . The arc length formula is used to find the length of an arc of a circle; $l = r\theta$ $l = r \theta$, where θ θ is in radian. Sector area is found $A = \frac{1}{2} \theta r^2$
 $A = \frac{1}{2} \theta r^2$, where θ θ is in radian.

Area of Sector with respect to Length of the Arc. If the length of the arc of the sector is given instead of the angle of the sector, there is a different way to calculate the area of the sector. Let the length of the arc be l . For the radius of a circle equal to r units, an arc of length r units will subtend 1 radian at the centre.

So, what's the area for the sector of a circle: $\alpha \rightarrow$ Sector Area; From the proportion we can easily find the final sector area formula: Sector Area = $\alpha * \pi r^2 / 2\pi = \alpha * r^2 / 2$. The same method may be used to find arc length - all you need to remember is the formula for a circle's circumference.
