In today's world, embedded systems are everywhere -- homes, offices, cars, factories, hospitals, plans and consumer electronics. Their huge numbers and new complexity call for a new design approach, one that emphasizes high-level tools and hardware/software tradeoffs, rather than low-level assembly-language programming and logic design.

Embedded System Design: A Unified Hardware/Software ...

An operating system created using software synthesis has no unnecessary functions. For example, many smaller, simpler embedded systems don't need hardware to perform memory management, context switching, or stack maintenance.
