Infinite Solutions Definition

An equation will produce an infinite solution if it satisfies some conditions for infinite solutions. An infinite solution can be produced if the lines are coincident and they must have the same y-intercept. The two lines having the same y-intercept and the slope, are actually the exact same line.

then there are "infinite solutions", meaning, when graphed, the two equations would form the same line. If the variables disappear, and you get a statement that is never true, such as $0 = 5$ or $4 = 7$, then there is "no solution", meaning, when graphed, the two equations would form parallel lines, which never intersect. It is possible to have more than solution in other types of equations that are not linear, but it is also possible to have no solutions or infinite solutions. No solution would mean that there is no answer to the equation. It is impossible for the equation to be true no matter what value we assign to the variable.

For a system of two linear equations and two variables, there can be no solution, exactly one solution, or infinitely many solutions (just like for one linear equation in one variable). If the two equations are in standard form (both variables on one side and a constant on the other side), then the following are true:
