System context diagram - Wikipedia

Systems Context Diagrams are a fundamental early product that systems engineers need to develop to get the program started off right. As we note in Kossiakoff, Sweet, Seymour, and Biemer, Systems Engineering Principles and Practice, System Context Diagrams... represent all external entities that may interact with a system... Such a diagram pictures the system at the center, with no details of its interior structure, surrounded by all its interacting systems, environments and activities.

The system context diagram (also known as a level 0 DFD) is the highest level in a data flow diagram and contains only one process, representing the entire system, which establishes the context and boundaries of the system to be modeled. It identifies the flows of information between the system and external entities (i.e. actors).

What is System Context Diagram?

A Context Diagram is a component of Functional Modelling that stands on its own as a valuable tool. It allows a team or an individual to produce a high-level model of an existing or planned system that defines the boundary of the system of interest and its interactions with the critical elements in its environment.

Another name for a Context Diagram is a Context-Level Data-Flow Diagram or a Level-0 Data Flow Diagram. Since a Context Diagram is a specialized version of Data-Flow Diagram, understanding a bit about Data-Flow Diagrams can be helpful. A Data-Flow Diagram (DFD) is a graphical visualization of the movement of data through an information system. DFDs are one of the three essential components of the structured-systems analysis and design method (SSADM).
